**AMINO B BOOSTER™
Helps Your Bees to Thrive**

- Uses for early spring feeding and brood build up for pollination to maximize production.
- Use to rapidly build up packages, nucs and swarms.
- Use for feeding bees during times of colony dwindling, late winter, mid-summer, and droughts.
- **Provide all amino acids needed for healthy nurse bees and for production of high quality bee milk and royal jelly for queen production.**
- To build and strengthen weak colonies; especially following *Nosema ceranae* attack or after pesticide injury.
- Use as a 'Protein drench' when bees take pollen patties very slowly: **spray or drizzle the Amino-B Booster™ and HBH into the brood area.**
- Reduce 'protein stress' - when bees are producing brood and available pollen sources are limited in quantity and quality of essential amino acids

Using only certified ingredients, AMINO-B-BOOSTER™ is produced in a modern, state-of-the-art FDA-licensed food manufacturing facility under strict 2GMP guidelines.

Always use Amino B Booster™ with Honey-B-Healthy®

Promotes Healthy, Vigorous Hives

*Use as a feeding stimulant for late winter, early spring, fall feedings and dearths of nectar.
Furthermore, add to your feeding mix to help build up packages, nucs and swarms.*

A 16 oz. bottle makes up about 96 quart jars of feed at 1 tsp. (5ml) per quart 1:1 sugar water or 24 gallons of recommended feeding mix at 1 tsp (5ml) per quart of sugar water and can be increased to 2 teaspoons per quart for emergency protein drench or better to spray and do not use too much to cause drowning of the bees. Be sure to add Honey-B-Healthy® to help preserve the mix. Keep container closed when not using. If feeding in open barrels, feed during times of nectar dearth when there is a rapid consumption of the mix by the bees and keep plenty of straw, etc. on the top of the barrel mix to prevent the bees from being submerged and drowning. Best fed in inverted jars on the top of the colony to prevent bees from drowning in open feeders (not recommended) and never return any used mix into original bottle.

Bees swarm over jars containing Amino-B Booster™ + Honey B Healthy® compared to jars with syrup + Honey B Healthy® or with syrup + Amino-B Booster™ alone. The mixture of the three components, 1:1 [this ratio can vary] sugar syrup, Amino-B Booster™ and Honey-B-Healthy® is synergistic: the mixture of all three components produces a greater effect than any one or two component(s) alone.

Using Amino B Booster™ with sugar syrup alone should not be done; the mixture will ferment and may harm the bees. Always add Honey-B-Healthy®, the real thing, which greatly helps to reduce or inhibit fermentation. Poorly made imitation products stated to be the same as Honey-B-Healthy® may not protect the mixture of syrup and Amino-B Booster™. The mixture may ferment and harm your bees.

REMEMBER: Remove honey supers when feeding Amino-B Booster™.

Feeding Amino-B Booster™ bees just prior to winter cluster is not recommended, unless you know what you are doing and you have surplus honey on your bees. Producing several frames of brood all winter in northern climates will cause the bees to consume honey at a very high rate, and may contribute to the death of weak or stressed colonies. However, if you want to pollinate almonds in February, and you have sufficient honey to feed the bees, this is an excellent way to add more frames of brood to your colonies.

Amino-B Booster™ can be mixed in syrup solutions ahead of time and kept in tightly sealed containers and fed when needed for short periods of time. Be sure to add 1 tsp. (5 ml) of Honey B Healthy® to each quart of syrup to prevent fermentation. To insure even distribution of essential oils after lengthy storage, mix or stir before applying to hive feeders.

Feeding Amino B Booster™ & Honey-B-Healthy® can invite robbing during times of extreme dearth of nectar, especially during late summer and early fall. If this occurs we suggest feeding during evening within the hive and reducing the entrance to prevent robbers from entering.
